Monetary Policy Review: No. 02 - March 2024

The Central Bank of Sri Lanka further reduces policy interest rates

The Monetary Policy Board of the Central Bank of Sri Lanka, at its meeting held on 25 March 2024, decided to reduce the Standing Deposit Facility Rate (SDFR) and the Standing Lending Facility Rate (SLFR) of the Central Bank by 50 basis points (bps) to 8.50 per cent and 9.50 per cent, respectively. The Board arrived at this decision following a comprehensive assessment of current and expected domestic and international economic developments, to maintain inflation at the targeted level of 5 per cent over the medium term, while enabling the economy to reach its potential. In arriving at this decision, the Board took note of, among others, subdued aggregate demand conditions, the lesser-than-expected impact of the recent changes to the tax structure on inflation, favourable near-term inflation dynamics due to the recent adjustment to electricity tariffs, well-anchored inflation expectations, the absence of excessive external sector pressures and the need to continue the downward trajectory in market interest rates. The Board observed that the possible upside risks to inflation in the near term would not materially change the medium-term inflation outlook, as economic activity is projected to remain below par for an extended period. The Monetary Policy Board underscored the need for a swift and full passthrough of monetary easing measures to market interest rates, particularly lending rates, by the financial institutions, thereby accelerating the normalisation of market interest rates in the period ahead.

Inflation is expected to converge to the targeted level in the period ahead

Headline inflation, as measured by the year-on-year change in the Colombo Consumer Price Index (CCPI, 2021=100), decelerated to 5.9 per cent in February 2024 from 6.4 per cent in January 2024, mainly driven by the deceleration in non-food inflation. Although food inflation accelerated on a year-on-year basis in February 2024, a month-on-month deflation was recorded, reflecting the easing of food prices. Core inflation that reflects underlying demand pressures in the economy remained subdued at 2.8 per cent in February 2024. Moreover, realised inflation for the first two months of 2024 indicates that the impact of the Value Added Tax (VAT) amendments effected in January 2024 on inflation may not be as large as initially envisaged. Further, compared
to the previous projections, headline inflation is anticipated to moderate in the forthcoming months, as the effects of the temporary uptick in inflation driven by the VAT amendments are expected to be partly offset by the recent downward revision to the electricity tariff and the moderation in food prices. However, inflation is expected to eventually converge to the targeted level in the period ahead and remain around the target over the medium term, supported by appropriate policy measures.

The fan chart illustrates the uncertainty surrounding the baseline projection path using confidence bands of gradually fading colours. The confidence intervals (CI) shown on the chart indicate the ranges of values within which inflation may fluctuate over the medium term. For example, the thick green shaded area represents the 50 per cent confidence interval, implying that there is a 50 per cent probability that the actual inflation outcome will be within this interval. The confidence bands show the increasing uncertainty in forecasting inflation over a longer horizon.

Note: A forecast is neither a promise nor a commitment.

The projections reflect the available data, assumptions and judgements made at the forecast round in March 2024. They are conditional on the forecasts of global energy and food prices; gradual growth recovery of Sri Lanka’s major trading partners; the anticipated domestic fiscal path in line with the IMF-EFF projections under the debt restructuring scenario and global financial conditions implied by the monetary policy stance of the USA. Further, the projections are conditional on the model-consistent interest rate path and the resulting macroeconomic responses. Any notable change in these assumptions could lead to the realised inflation path deviating from the projected path.

Given the prevailing domestic and global economic uncertainties, weather uncertainties and geopolitical tensions, the risks associated with the current projections are higher than in normal times. These risks arise due to the possibility of various factors deviating from the levels already internalised in projections, either explicitly or implicitly, and due to any unforeseen developments. In particular, there are upside risks to inflation projections stemming from factors such as the impact of the possible upward pressures on global food and energy prices amidst uncertainty; the impact of adverse weather on agricultural production and in turn on food prices; the possible upward revision to electricity tariff at the next round of revision; the possible realisation of higher wages, etc. Meanwhile, downside risks to inflation projections include a faster recovery of supply conditions; and the sustained impact of diminished purchasing power of the public.

The Central Bank remains committed to communicating any changes to the inflation outlook to the public on a regular basis, enabling the public to make informed decisions.
The recovery in domestic economic activity is expected to continue

As per the GDP estimates published by the Department of Census and Statistics (DCS), the economy is estimated to have grown by 4.5 per cent, year-on-year, in the fourth quarter of 2023, following the moderate expansion of 1.6 per cent (year-on-year) recorded in the third quarter of 2023. Favourable growth outcomes recorded in the second half of the year helped limit the overall contraction of the economy to 2.3 per cent in 2023, compared to the contraction of 7.3 per cent (revised) recorded in 2022. This growth momentum is expected to continue in the upcoming quarters.

A further decline in market interest rates is warranted in the period ahead

The overall market interest rate structure has adjusted downwards in response to the monetary policy easing measures implemented thus far and the reduction of risk premia attached to yields on government securities following the implementation of the domestic debt optimisation (DDO) operation. However, the pace of reduction of market interest rates, particularly lending rates, slowed in recent months, and yields on government securities, which recorded a notable downward adjustment in the first two months of the year, have shown some reversal. Meanwhile, credit extended to the private sector by Licensed Commercial Banks (LCBs), which was in an expansionary phase since June 2023, witnessed a contraction of outstanding credit in January 2024, partly due to the valuation effects arising from the appreciation of the Sri Lanka rupee against the US dollar and possible post festive season settlements. However, credit growth resumed to some extent, as reflected by the preliminary data for February 2024. The prevailing accommodative monetary policy stance along with the reduction of policy interest rates effected today are expected to induce a further reduction in market lending rates and encourage the expansion of credit to the private sector by LCBs in the period ahead.

The external sector continued to maintain a positive momentum

The merchandise trade deficit is estimated to have widened in January 2024 compared to the same period in 2023, driven by a higher increase in imports. However, trade in services, mainly earnings from tourism, recovered significantly during the two months ending February 2024, while the positive momentum of workers’ remittances continued. Gross official reserves (GOR) improved to US dollars 4.5 billion by end February 2024, which include the swap facility from the People’s Bank of China. The reserve buildup was supported by considerable net purchases by the Central Bank from the domestic foreign exchange market amidst increased foreign currency inflows compared to outflows. The Sri Lanka rupee, which appreciated by 12.1 per cent against the US dollar in 2023, continued to show an appreciation of 6.7 per cent thus far in 2024, in spite
of notable foreign exchange purchases by the Central Bank. Meanwhile, the authorities reached a Staff Level Agreement on economic policies with the International Monetary Fund (IMF) following the second review of Sri Lanka’s Extended Fund Facility (EFF) arrangement and the 2024 Article IV consultation.

Policy interest rates are further reduced in view of the stable inflation outlook over the medium term and subdued demand pressures

In consideration of the current and expected macroeconomic developments highlighted above, the Monetary Policy Board of the Central Bank of Sri Lanka, at its meeting held on 25 March 2024, decided to reduce the Standing Deposit Facility Rate (SDFR) and the Standing Lending Facility Rate (SLFR) of the Central Bank by 50 bps to 8.50 per cent and 9.50 per cent, respectively. The Board viewed that the reasons for the recent and expected changes in inflation in the upcoming months were propelled by supply-driven and administratively determined prices, while noting that inflation expectations remained well anchored. The Board was of the view that a further easing of monetary policy would provide the required space for market interest rates, particularly lending rates, to adjust downwards further to levels conducive to continued expansion of credit to the private sector, thus supporting the ongoing revival of economic activity. In addition, the Monetary Policy Board was of the view that the MLA Order No. 01 of 2023 on Maximum Interest Rates on Rupee Denominated Lending Products issued in August 2023 contributed to reducing the overall market lending interest rates and therefore yielded the expected results. Given that the limits specified in the said Order are no longer relevant in the context of further monetary policy easing since its implementation, and with a view to moving away from administrative measures towards market-based instruments as the economy normalises, the Board decided to repeal the Monetary Law Act Order No. 1 of 2023 with immediate effect. Lastly, the Board noted the improvements in domestic money market activity alongside the improvement in liquidity conditions and decided to remove the remaining restrictions on the usage of the Standing Deposit Facility (SDF) of the Central Bank with effect from 01 April 2024. This would further support market-based transmission of monetary policy adjustments. The Board stressed the need for all financial institutions to take swift measures to reduce market lending interest rates to ensure that the benefits of the series of monetary policy easing measures are adequately passed on to businesses and households.

INFORMATION NOTE:

A press conference, chaired by Governor Dr. P Nandalal Weerasinghe, will be held on 26 March 2024 at 9.00 am at the Atrium of the Central Bank of Sri Lanka, and proceedings will be livestreamed on Facebook and YouTube.

The release of the next regular statement on monetary policy review is advanced and will be issued on 28 May 2024.
